

Amendment to the Claims

This listing of the claims replaces all prior versions and listings of claims in the application. Please amend claims 1 and 7 to incorporate the features of claim 13 which is deemed to comprise allowable subject matter and cancel claims 2, 4 13 as follows:

1. (Currently amended). A method of transmitting data over a wireless network, the method comprising:

receiving data for a first frame formatted according to a first cable bus protocol;
creating segmentation and reassembly (SAR) packet data units from the received data via an IEEE 1394 SSCS module;

~~inserting the data into packets as~~ segmentation and reassembly (SAR) packet data units in a long channel (LCH) packet via a segmentation and reassembly (SAR) module ~~of an IEEE 1394 SSCS layer~~ according to a format corresponding to layer 2 of a ~~first~~second protocol ~~for packaging in a long channel (LCH) packet~~ for data transmission over the wireless network;

constructing a frame in accordance with layer 2 of a ~~second~~third protocol for data transmission over the wireless network, the ~~second~~third protocol being different from the ~~first~~second protocol, the frame comprising said packets; and

transmitting the constructed frame over the wireless network according to the ~~second~~third protocol.

2. (Cancelled).

3. (Currently amended) The method according to claim ~~2~~1 wherein the cabled bus is an IEEE 1394 bus, the ~~first~~second protocol for data transmission over the wireless network is HiperLAN/2 and the ~~second~~third protocol for data transmission over the wireless network is a protocol from a family of IEEE 802.11 protocols.

4. (Cancelled).

5. (Currently amended) The method according to claim 1, wherein the frame is constructed from said packets according to an intermediate format defined by said layer 2 of the

~~first~~second protocol for data transmission over the wireless network, the constructed frame being in accordance with the ~~second~~third protocol for data transmission over the wireless network, the constructed frame being distinguished from other frames transmitted over the wireless network by a specific identifier in the constructed frame.

6. (Currently amended) The method according to claim 1, wherein the frame is constructed from said packets according to an intermediate format defined by said layer 2 of the ~~first~~second protocol for data transmission over the wireless network and in accordance with the ~~second~~third protocol for data transmission over the wireless network, the constructed frame being distinguished from other frames through the use of specific media access control (MAC) addresses identifying origin and destination of the constructed frame.

7. (Currently amended) A data transmission apparatus comprising:

means for receiving data for a first frame ~~according to a first protocol and~~ formatted according to a first cabled bus protocol,

means for connecting to a wireless network,

an IEEE 1394 SSCS module for processing the received data to create segmentation and reassembly (SAR) packet data units;

a segmentation and reassembly module for processing the first frame formatted according to the cabled bus to insert the data received for inserting the segmentation and reassembly (SAR) packet data units on the cabled bus into a second frame in a long channel (LCH) packet according to a format defined by a second protocol for data transmission over the wireless network,

wherein the apparatus further comprises means for generating the second frame for transmission in accordance with layer 2 of the second protocol for data transmission over the wireless network, the second protocol being different from ~~the first~~third protocol for data transmission over the wireless network, by inserting packets of said received data from the cabled bus, the packets of said received data being formatted according to layer 2 of the ~~first~~third protocol.

8. (Currently amended) The apparatus according to claim 7, wherein the cabled bus is an IEEE 1394 bus, the ~~first~~second protocol for data transmission over the wireless network is HiperLAN/2 and the ~~second~~third protocol for data transmission over the wireless network is a protocol from a family of IEEE 802.11 protocols.

9. (Currently amended) The apparatus according to claim 7, wherein the generated frame comprises layer 2 necessary for encapsulation and transmission of packets as said frame for transmission generated with aid of said layer 2 of the ~~first~~third protocol.

10. (Previously presented) The method according to claim 5, wherein the specific identifier comprises a logical link control packet appended to an IEEE 802.11 frame.

11. (Previously presented) The method according to claim 6, wherein the specific MAC addresses comprise first and second addresses, a first address at an IEEE 802.11 driver level and a second address created by repeating IEEE 802.11 authentication and association phases.

12. (Previously presented) The method according to claim 3, the first HyperLAN/2 protocol convergence layer 2 obtaining the packets as segmentation and reassembly packet data units.

13. (Cancelled).
